

ATS Compatibility Report

Candidate: Jordan Ellis

Target Role: Senior Backend Engineer at Meridian Cloud Technologies

ATS Score: 47.22 / 100

The candidate scores 47.22/100 on the ATS, reflecting a solid foundation in backend technologies but falls short of senior-level expectations. While experience and project work are fully matched, critical gaps include missing FastAPI/Django, Kubernetes, CI/CD, and infrastructure-as-code competencies, as well as limited evidence of mentoring or leading technical initiatives. These gaps, combined with weak bullet-point language, reduce overall fit for a Senior Backend Engineer role.

Score Breakdown

- Keyword Match (30%): 27.59%
- Skills Match (25%): 37.5%
- Experience Match (20%): 100.0%
- Project Match (10%): 45.71%
- Education Match (10%): 0.0%
- Formatting (5%): 100.0%

Strengths

- 100% experience match, demonstrating relevant backend engineering experience
- Strong match on core backend technologies: Python, Flask, PostgreSQL, Docker, AWS, pytest, on-call responsibilities
- Precise formatting with no ATS parsing issues, ensuring all sections are correctly parsed
- Project match of 45.71%, indicating hands-on experience delivering backend solutions

Weaknesses

- Lacks senior-level backend frameworks such as FastAPI, Django, and gRPC
- No experience with container orchestration (Kubernetes) or infrastructure-as-code tools (Terraform, IaC)
- Missing CI/CD pipeline expertise and incident response/on-call leadership for senior roles
- Absence of microservices, event-driven, and distributed systems design skills (Kafka, SQS, event-driven architectures)
- Weak action verbs and 7 subpar bullet points that understate impact and leadership

Missing Keywords

Senior Backend Engineer, FastAPI, Django, gRPC, Kubernetes, CI/CD, incident response, event-driven, Kafka, SQS, Terraform, Infrastructure as code, GraphQL, microservices, distributed systems, scalable APIs, observability, testing, system design, mentoring, open source

Missing Skills

FastAPI, Django, Kubernetes, REST API design, Microservices architecture, CI/CD pipelines, Kafka, SQS, Event-driven architectures, Terraform, Infrastructure as code, GraphQL, Mentoring engineers, Leading technical initiatives, Open source contributions

Improved Professional Summary

Senior Backend Engineer with 4 years of experience building Python-based REST APIs and data pipelines using Flask, PostgreSQL, Docker, and pytest. Proven track record of maintaining reliable services, migrating databases, and developing automated ETL workflows. Eager to leverage these skills to design scalable backend systems and contribute to robust CI/CD pipelines.

Key Achievements

- Maintained the Flask-based internal billing API, ensuring consistent service for internal billing operations.
- Migrated the reporting database from MySQL to PostgreSQL, improving data consistency and query performance.
- Developed a nightly ETL job that synchronizes data from three vendor APIs, enabling timely reporting.
- Collaborated with senior engineers to write unit tests for the payments module, enhancing test coverage.
